**BACKUP MONITORING - VERITAS BACKUP JOB ANALYSIS (Success / Failure)**

Description

The complexity and volatility of backup operations make it difficult for companies to understand their true backup success rate, and more importantly, the recoverability of their data. As a result, companies are exposed to substantial business risk from lost data, leaving their IT departments scrambling to identify, troubleshoot and remedy sources of failure before the next backup window. The purpose of this report is to provide a concise document about the backup success, failures, root causes and performance.

■ Success ■ Failed ■ Cancelled

Network Health			Definitions
Understanding Server Availability			<ul style="list-style-type: none"> <li>• <b>Availability:</b> How much time your servers were available on the network. The lower the percentage the more down time you are experiencing.</li> <li>• <b>CPU Utilization:</b> This is a measure of how hard your servers are working. The higher the percentage the harder your server is working.</li> <li>• <b>Paging File Utilization:</b> This is a measure of how much the servers are using the hard disk to swap memory. The higher the percentage might indicate that it is time for a memory upgrade.</li> <li>• <b>Patches:</b> This represents the percentage of all security patches that have been approved for deployment.</li> <li>• <b>Adequate Disk Space:</b> This represents the percentage of workstations that do not have low disk space.</li> <li>• <b>Anti-Virus:</b> This represents the percentage of systems with up to date Anti-Virus definitions.</li> </ul>
